ETH Deployment by Risk Preference (No-Strategy Only)

ETH Deployment by Holding Style (No-Strategy Only)

Prompt Toggle Reference: What Moves Each Metric (No-Strategy Agents)

TOGGLE 1: BUY:SELL RATIO → Target: > 1.0

INCREASES B:S (more buying relative to selling):		
+ Hold prohibitions ('do NOT sell before hold floor')	v2.9: +0.44	STRONG
+ Reap hold-through ('hold, don't panic-sell')	v2.17: +0.96	STRONG
+ Remove reap-based sell authorizations	v2.17: (included above)	
+ Position commitment framing	v2.11: modest but note HS-damping side effect	
+ ARP blockade fix (unblock buying for ARP=1-2)	v2.8: +0.71	
+ Fee awareness (suppresses sells more than buys)	v2.9: contributes to buy-bias	

DECREASES B:S (more selling / balanced):		
- Anti-rebalancing + strategy completion	v2.11: -0.65	
- Remove OBSERVE floors (agents trade more → sell more)	v2.15-v2.19: progressive decline	
- Full dump permission removal	v2.10: modest	

KEY INSIGHT: B:S is dominated by SELL SUPPRESSION mechanisms.

Hold floors + reap awareness are the two strongest buy-biasers.

To maintain B:S > 1.0: keep hold floors and reap hold-through language.

The late versions (v2.19-v2.20) went sell-heavy (0.56) because high trade rates + no OBSERVE floors = agents churn through positions rapidly.

TOGGLE 2: TRADE RATE → Target: 5-20%

DECREASES trade rate (toward target):		
+ OBSERVE % floors (TA-specific hard targets)	v2.9: -17pp STRONGEST SINGLE TOGGLE	
- TA5:70%, TA4:80%, TA3:88%, TA2:93%, TA1:97%		
- WARNING: Too aggressive → inverts TA gradient (v2.12)		
+ Fee costs at top of prompt (2.3%/trade)	v2.9: -16pp	(but causes fee-paralysis)
+ Anti-rebalancing (33.3% target prohibition)	v2.11: -7pp	
+ Same-token rebuy cooldown (6 ticks)	v2.11: contributes -3pp	
+ Go template conditionals (targeted slider combos)	v2.10-v2.11: -3 to -17pp on targeted groups	
+ Strategy override rate limit	v2.12: modest	
+ 'Most ticks → OBSERVE' opening line	v2.7-v2.14: present → ~8-25% rate	

INCREASES trade rate (away from target):		
- Remove OBSERVE % floors	v2.15: floors removed → rate stays ~8%	
BUT v2.17+: rate explodes to 30-70% as other constraints also relax		
- Remove 'Most ticks → OBSERVE' opening	v2.15: alone modest, combined = large	
- Remove anti-passivity prompt	v2.12: removed, trade rate kept falling	

- RECOMMENDED COMBINATION for 5-20%:
- MODERATE OBSERVE floors: TA5:50%, TA4:65%, TA3:80%, TA2:90%, TA1:95%
(lower than v2.12's aggressive floors that inverted TA gradient)
 - Keep fee awareness at top of prompt BUT add anti-paralysis clause
 - Keep anti-rebalancing and rebuy cooldown
 - Keep Go conditionals for churn-prone slider combos
 - Use soft pacing language, NOT 'Most ticks → OBSERVE'

TOGGLE 3: ETH DEPLOYMENT → Target: ~75%

INCREASES deployment (toward 75%):		
+ Reap awareness (hold = free allocation)	v2.17: +38pp	MASSIVE
+ Remove OBSERVE floors (agents buy more)	v2.15-v2.19: progressive	
+ Higher trade rate in general → more buying opportunities		

DECREASES deployment:		
- OBSERVE floors suppress buying → ETH stays undeployed	v2.9-v2.12: 20-40% deploy	
- Anti-rebalancing can prevent deployment spread	v2.11: modest	
- Fee awareness can suppress buying	v2.9: contributes to low deploy	

KEY INSIGHT: ETH deploy is mostly a function of TRADE RATE.

Low trade rate → low deploy (agents never buy → ETH sits).

v2.12 had 7.7% trade rate and only 21% deploy.

v2.17 had 30% trade rate and 78% deploy.

The 75% target requires trade rate in the 15-30% range, combined with buy-favoring B:S ratio (>1.0).

ARP slider has WEAK effect on deploy (surprising).

HS slider has MODERATE effect – HS=1 agents deploy more because they churn through positions (buy-sell-buy-sell).

Version Scorecard: Distance from Target (No-Strategy)

Version	B:S	vs Target	Rate %	vs Target	Deploy %	vs Target	Score
v2.7 — Baseline	0.69	-0.31	39.7%	+27.2pp	28.7%	-46.3pp	28/100
v2.8 — ARP fix, fee drag	1.40	+0.40	42.8%	+30.3pp	24.9%	-50.1pp	42/100
v2.9 — Fee front+center	1.84	+0.84	23.3%	+10.8pp	42.1%	-32.9pp	49/100
v2.10 — HS1 hold floor, condit	1.34	+0.34	22.3%	+9.8pp	23.3%	-51.7pp	47/100
v2.11 — Anti-rebalancing	1.19	+0.19	15.5%	+3.0pp	39.6%	-35.4pp	69/100
v2.12 — OBSERVE floors up	1.03	+0.03	7.7%	-4.8pp	21.2%	-53.8pp	53/100
v2.13 — Soften TA5	3.34	+2.34	6.8%	-5.7pp	34.0%	-41.0pp	33/100
v2.14 — [HIGH] strategy hierar	3.23	+2.23	9.2%	-3.3pp	57.7%	-17.3pp	50/100
v2.15 — Remove OBSERVE floors	2.33	+1.33	7.7%	-4.8pp	51.9%	-23.1pp	58/100
v2.16 — Reasoning simplificati	2.96	+1.96	8.4%	-4.1pp	42.9%	-32.1pp	42/100
v2.17 — Reap awareness	2.80	+1.80	30.2%	+17.7pp	78.0%	+3.0pp	36/100
v2.18 — Auto-detected	1.12	+0.12	41.6%	+29.1pp	4.3%	-70.7pp	27/100
v2.19 — Auto-detected	0.56	-0.44	71.2%	+58.7pp	75.1%	+0.1pp	46/100
v2.20 — Auto-detected (latest)	0.51	-0.49	55.3%	+42.8pp	61.7%	-13.3pp	39/100

Recommended Prompt Configuration for Target Metrics

TARGETS: B:S > 1.0 | Trade Rate 5-20% | ETH Deploy ~75%

BEST-FIT VERSION: v2.17 (no-strategy: B:S=2.80, Rate=30.2%, Deploy=78.0%)

- Deploy is on target (78% ≈ 75%)
- B:S is above target (2.80 > 1.0) – good direction, maybe overshoot
- Trade rate is too high (30.2% > 20%) – needs OBSERVE floors back

RECOMMENDED CHANGES TO v2.17 BASE:

1. RE-INTRODUCE MODERATE OBSERVE FLOORS

Problem: v2.17 removed all OBSERVE floors → 30% trade rate

Fix: Add back softer floors that don't invert TA gradient:

TA=1: ~95% observe (trade ~1 in 20 ticks)

TA=2: ~88% observe (trade ~1 in 8)

TA=3: ~78% observe (trade ~1 in 5)

TA=4: ~65% observe (trade ~1 in 3)

TA=5: ~50% observe (trade ~1 in 2)

These are LOWER than v2.12's aggressive floors that inverted the gradient.

Expected impact: trade rate 30% → ~12-18%

2. KEEP REAP AWARENESS (from v2.17)

This is the single biggest ETH deploy driver (+38pp).

Also supports B:S > 1.0 by preventing panic sells.

Do NOT remove or weaken.

3. KEEP HOLD FLOORS + ANTI-REBALANCING (from v2.10-v2.11)

Hold floors suppress sells → B:S > 1.0

Anti-rebalancing prevents churn → lower trade rate

Same-token rebuy cooldown prevents position churning

4. FEE AWARENESS: KEEP BUT ADD ANTI-PARALYSIS

Fee awareness at top of prompt is good for trade rate suppression.

BUT must include: 'fees should inform timing, not prevent all trading.'

Without anti-paralysis, TA=2 agents drop 61% (v2.9 lesson).

5. SOFT PACING LANGUAGE (NOT 'Most ticks → OBSERVE')

Use: 'Be selective and deliberate. Quality over quantity.'

NOT: 'Most ticks should result in OBSERVE' (too suppressive)

NOT: No pacing language at all (leads to 30-70% rate)

6. GO CONDITIONALS: KEEP THE WORKING ONES

Conditionals from v2.10-v2.11 that target churn-prone combos:

HS1+TA3+, HS1+DIV4+, TA4+HS4+, TA4+TS4+, TA4+Risk≤2, TA3+HS=3

These provide targeted control without global overcorrection.

7. STRATEGY HIERARCHY: KEEP [HIGH] OVERRIDE

Doesn't affect no-strategy agents but essential for strategy agents.

[HIGH] skip gate at frequency governor lets strategy agents bypass floors.

EXPECTED OUTCOME:

B:S Ratio:	1.5 - 2.5	(hold floors + reap awareness maintain buy bias)
Trade Rate:	10 - 18%	(moderate OBSERVE floors + anti-churn mechanisms)
ETH Deploy:	65 - 80%	(reap awareness drives deployment; floors moderate it)
TA Gradient:	monotonic	(softer floors avoid v2.12 inversion)
