

Strategy Alignment Analysis

Do Agents Follow Their Trading Strategies?

5,903 trades analyzed using Claude Sonnet

Generated: 2026-01-10 21:00

EXECUTIVE SUMMARY: STRATEGY ALIGNMENT ANALYSIS

KEY FINDING: 72.2% OF TRADES ALIGN WITH AGENT STRATEGIES

This analysis used Claude Sonnet to classify 5,903 trades from 306 agents to determine whether each trade aligned with the agent's stated strategy.

OVERALL RESULTS:

ALIGNED: 4,261 trades (72.2%) - Trade clearly follows strategy
UNALIGNED: 971 trades (16.4%) - Trade contradicts or ignores strategy
PARTIAL: 668 trades (11.3%) - Trade somewhat related to strategy
BASELINE: 3 trades (0.1%) - Generic trade not driven by strategy

BY STRATEGY PRIORITY:

High Priority: 75.7% aligned (agents follow high-priority strategies more)
Medium Priority: 70.9% aligned
Low Priority: 69.7% aligned

BY TRADE TYPE:

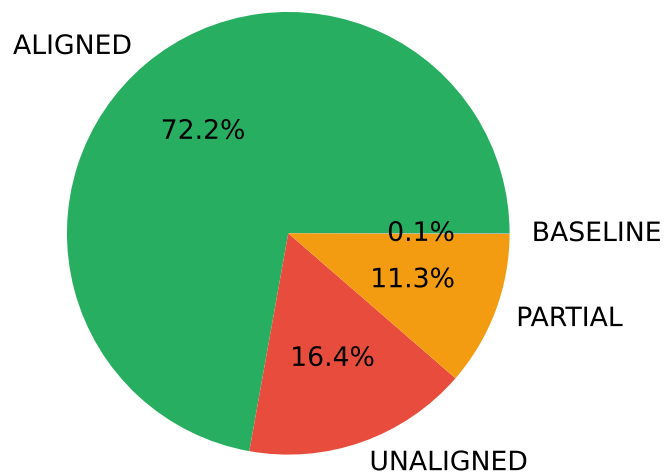

BUY trades: 76.1% aligned (agents buy what strategy says)
SELL trades: 67.8% aligned (sells are less aligned)
24.3% of sells are UNALIGNED vs only 9.4% of buys

IMPLICATION:

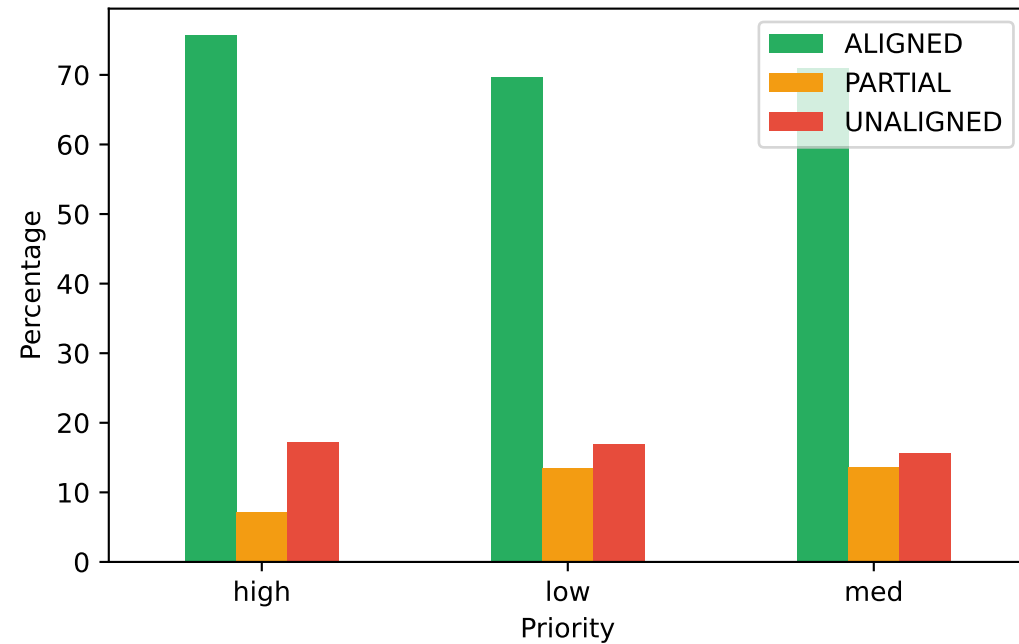

Agents are reasonably good at following their strategies, especially for buys.
Sell decisions appear more opportunistic and less strategy-driven.

Alignment by Strategy Priority

SUMMARY STATISTICS

Total trades: 5,903

Unique agents: 306

Unique strategies: 150

Average confidence: 0.89

Alignment by Trade Type

Which Types of Strategies Get Followed?

ALIGNMENT RATE BY STRATEGY CATEGORY

Category	Alignment	Description
MOMENTUM	85.5%	"buy strength after breakout..."
VOLUME_BASED	78.9%	"only trade with rising volume..."
HOLD	78.7%	Strategies that emphasize holding
MULTI_TOKEN	78.3%	Mention 3+ specific tokens
DIP_BUY	76.9%	"buy dips", "mean reversion"
HAS_PRICE_TARGET	75.7%	Include 2x, 3x, etc. targets
DIVERSIFY	68.0%	"diversify equally..."
RESTRICTIVE	66.7%	Use "only" or "ignore"
GENERAL	66.6%	Generic strategies
DUAL_TOKEN	65.7%	Mention exactly 2 tokens
SINGLE_TOKEN	57.2%	Focus on one token only
LEVERAGE	47.0%	Mention leverage (can't execute!)
ALL_IN	25.5%	"Go all-in" strategies

KEY INSIGHTS:

- 1. MOMENTUM & VOLUME strategies work best (85-79% aligned)
 - These are flexible and match market conditions
 - Example: "Buy when volume spikes, sell when hype fades" = 100% aligned!
- 2. ALL_IN strategies fail badly (25.5% aligned)
 - Agents won't actually go all-in on one token
 - They diversify regardless of strategy
 - Example: "Go all-in on TURBO, ignore everything else" = 7% aligned
- 3. LEVERAGE strategies can't be executed (47% aligned)
 - No leverage functionality exists
 - "leverage 5x" is meaningless
- 4. SINGLE_TOKEN strategies underperform (57%)
 - Agents naturally want to diversify
 - Restrictive strategies get partially ignored

Best vs Worst Followed Strategies (min 20 trades)

BEST FOLLOWED STRATEGIES (Highest Alignment):

1. [100%] Buy when volume spikes, sell when hype fades.
2. [100%] Sell Turbo, buy Pink Llama—least holders, biggest contr...
3. [100%] Buy momentum leaders ECHO and TURBO, hold rest, exit at...

5. [17%] Go all in on BANANA and SHAM, leverage 5x, exit at 10x ...
6. [24%] Accumulate Banana slowly—it has the most holders and hi...
7. [31%] BUY TURBO token when price shows bullish momentum (e.g....
8. [34%] Diversify equally, hold through volatility, sell 20% at...

PATTERN ANALYSIS:

Best strategies are FLEXIBLE:

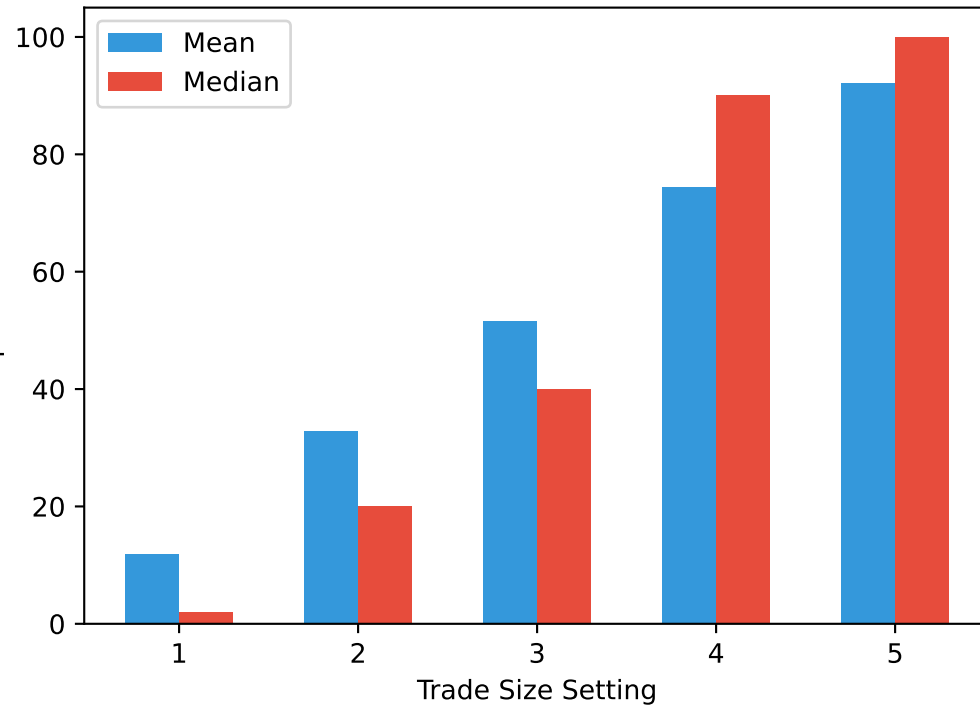

- Volume-based triggers
- Momentum signals
- Clear but achievable targets (2x, 3x)

Worst strategies are RESTRICTIVE:

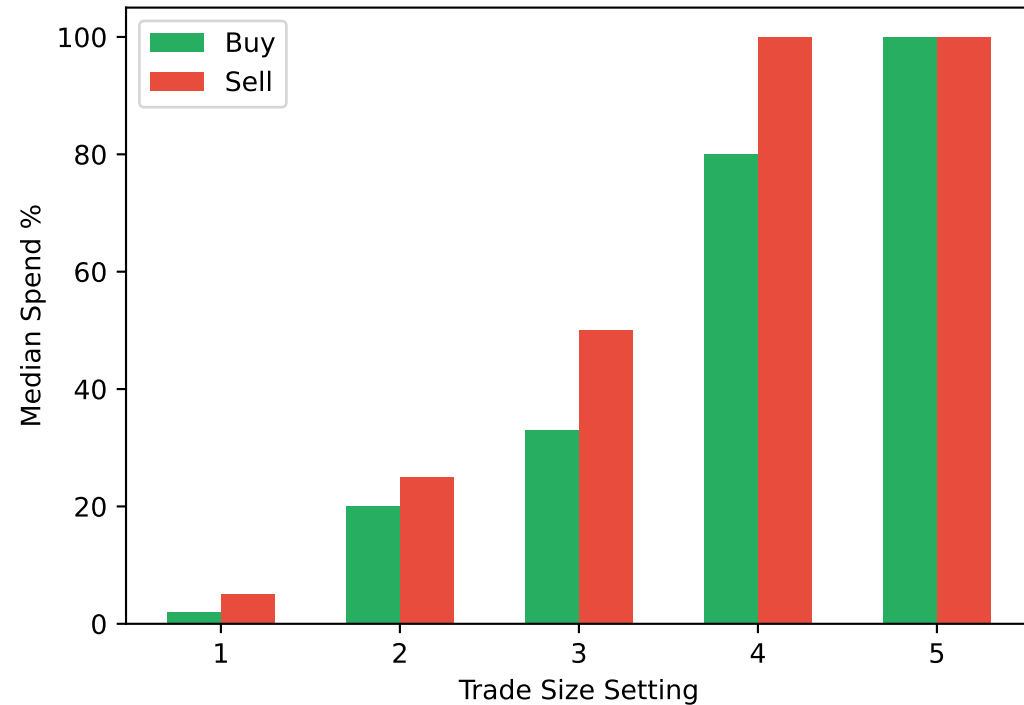

- "Go all-in" (agents won't)
- "Ignore everything else" (they don't)
- Leverage (impossible)
- Specific times ("at 3am UTC")

Slider Validation: Trade Size Setting

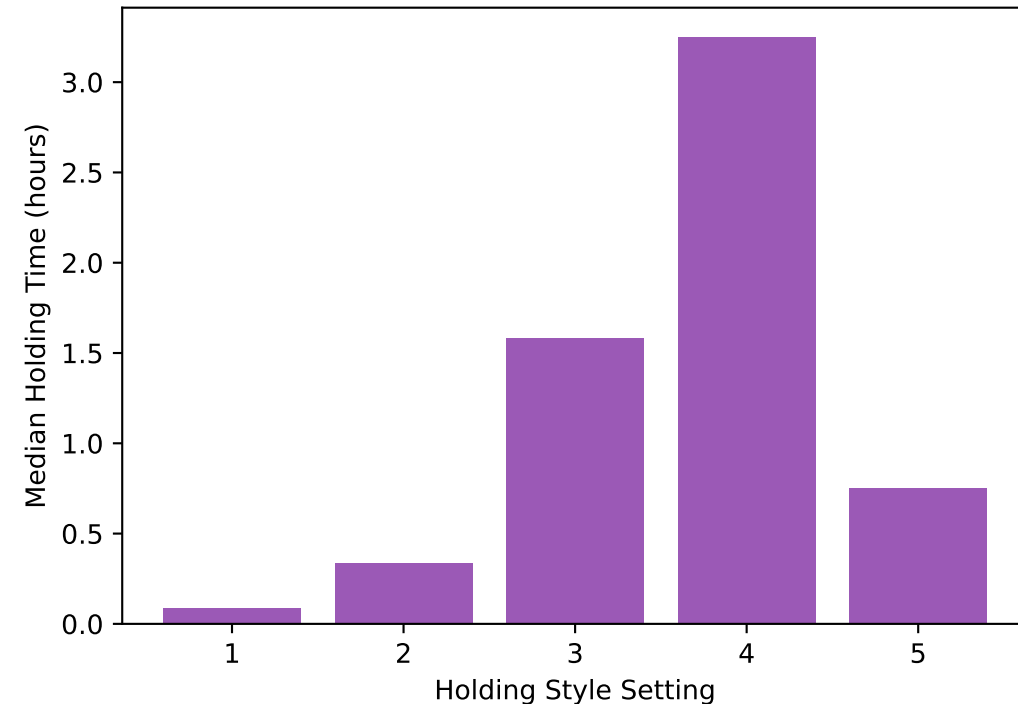

Trade Size: Strong Validation

By Trade Type

Holding Duration: Partial Validation

SLIDER VALIDATION SUMMARY

TRADE SIZE: STRONG VALIDATION ✓

Setting 1: Median 2% spend

Setting 3: Median 40% spend

Setting 5: Median 100% spend

HOLDING STYLE: PARTIAL VALIDATION

Setting 1: 0.08 hrs (quick trades)

Setting 3-4: 1.5-3.2 hrs (longer)

Setting 5: Lower than expected

(Small sample at setting 5)

Conclusions & Recommendations

CONCLUSIONS

=====

1. AGENTS GENERALLY FOLLOW STRATEGIES (72% alignment)
 - Most trades are consistent with stated strategies
 - Buy decisions are more aligned than sell decisions
 - Higher priority strategies get better adherence
2. STRATEGY DESIGN MATTERS
 - Flexible strategies (momentum, volume-based) work best
 - Restrictive strategies ("only", "ignore", "all-in") underperform
 - Impossible strategies (leverage) obviously fail
3. SLIDER SETTINGS VALIDATE WELL
 - Trade Size: Strong validation (1→5 maps to 2%→100%)
 - Holding Style: Partial validation (trend correct, edge cases weak)
 - Risk Preference: Correlates with P&L (shown in P&L report)

RECOMMENDATIONS FOR STRATEGY DESIGN

=====

DO:

- Use flexible triggers (volume, momentum, price action)
- Include clear but achievable price targets (2x, 3x)
- Mention multiple tokens for diversity
- Allow room for opportunistic trades

DON'T:

- Use "go all-in" language (agents won't)
- Require leverage (impossible)
- Focus on single tokens exclusively
- Include time-based triggers ("at 3am")
- Use "ignore everything else" (they won't)

BEST PERFORMING STRATEGY TEMPLATES:

"Buy [tokens] on [condition], sell at [target], hold through volatility"

"Momentum: buy strength after breakout, scale out at +X%, +Y%, +Z%"

"Volume-based: only trade with rising volume and widening support"

APPENDIX A: Why "All-In" Strategies Fail - Case Study 1

STRATEGY: "Go all-in on BANANA, leverage 5x, and ride the pump to 10x or bust."

=====

Alignment Rate: 0.0% (0 of 53 trades aligned)

AGENT CONFIGURATION:

trading_activity:	2	risk_preference:	5
trade_size:	2	holding_style:	1 (INSTANT EXIT)
diversification:	4		

WHY IT FAILED - THE SLIDER CONFLICT:

Strategy says: "Go all-in... ride the pump to 10x"

Sliders say: trade_size=2 (small trades), holding_style=1 (exit immediately)

Result: Agent CANNOT go all-in (small trade size) and CANNOT hold to 10x (instant exit)

ACTUAL TRADE SEQUENCE (first 15 of 53 trades):

1. [PARTIAL] buy BANANA - Bought BANANA but not "all-in"
2. [PARTIAL] buy BANANA - Another small incremental buy
3. [UNALIGNED] sell BANANA - Sold! (holding_style=1 overrides strategy)
4. [UNALIGNED] buy TURBO - Bought different token! (diversification=4)
5. [UNALIGNED] sell TURBO - Instant exit again
6. [UNALIGNED] buy TURBO - Back to TURBO
7. [UNALIGNED] sell TURBO - Exit
8. [UNALIGNED] buy BANANA - Back to BANANA
9. [PARTIAL] buy BANANA - More BANANA
10. [UNALIGNED] sell BANANA - Exit again (can't hold!)

... pattern continues for 53 trades total

KEY INSIGHT:

The agent's SLIDER SETTINGS completely override the STRATEGY TEXT.

With holding_style=1, the agent will NEVER "ride to 10x" regardless of strategy.

With trade_size=2, the agent will NEVER truly "go all-in".

APPENDIX A: Why "All-In" Strategies Fail - Case Study 2

STRATEGY: "Go all in on TURBO, ignore the rest, ride the pump or burn."

=====

Alignment Rate: 4.6% (4 of 87 trades aligned)

AGENT CONFIGURATION:

trading_activity:	3	risk_preference:	4
trade_size:	3	holding_style:	2 (EARLY PROFIT-TAKING)
diversification:	4		

WHY IT FAILED - HOLDING STYLE CONFLICT:

Strategy says: "ride the pump or burn" (hold indefinitely)
Sliders say: holding_style=2 (take profits early)

Result: Agent keeps selling to "take profits" instead of riding

ACTUAL TRADE PATTERN:

Trades 1-4: [PARTIAL] buy TURBO x4 - Building position (but not "all-in")
Trades 5-35: [UNALIGNED] sell TURBO x31 - Constant selling! (holding_style=2)
Trade 78: [UNALIGNED] buy SHAM - Bought different token! ("ignore the rest")
Trade 79: [ALIGNED] sell SHAM - Sold SHAM to buy TURBO (actually aligned!)
Trade 80: [ALIGNED] buy TURBO - Following strategy
Trade 81: [UNALIGNED] sell TURBO - Back to profit-taking
Trade 82: [UNALIGNED] buy ECHO - Another token!

THE 4 ALIGNED TRADES:

The only aligned trades were when the agent:

1. Sold non-TURBO tokens to reallocate to TURBO
2. Bought TURBO with maximum allocation

But these were immediately followed by sells (holding_style override)

KEY INSIGHT:

Strategy says "ignore the rest" but diversification=4 drives multi-token trading.
Strategy says "ride the pump" but holding_style=2 forces early exits.
Only 4.6% alignment because slider behavior dominates strategy text.

APPENDIX A: Strategy vs Slider Conflict Summary

WHY "ALL-IN" AND "RIDE TO 10X" STRATEGIES ALWAYS FAIL

=====

STRATEGY ELEMENT	REQUIRED SLIDER	TYPICAL AGENT HAS	RESULT
-----	-----	-----	-----
"Go all-in"	trade_size = 5	trade_size = 1-3	Small buys only
"Ride to 10x"	holding_style = 5	holding_style = 1-2	Exits early
"Ignore the rest"	diversification = 1	diversification = 3-4	Buys multiple
"Leverage 5x"	N/A (impossible)	N/A	Ignored

THE FUNDAMENTAL PROBLEM:

=====

Slider settings are BEHAVIORAL CONSTRAINTS that override strategy text.

An agent with holding_style=1 will ALWAYS exit quickly, even if their strategy says "hold forever" or "ride to the moon".

An agent with diversification=4 will ALWAYS buy multiple tokens, even if their strategy says "only buy TURBO, ignore everything else".

RECOMMENDATIONS FOR STRATEGY DESIGN:

=====

1. DON'T write strategies that conflict with likely slider settings
 - Avoid "go all-in" unless you know trade_size will be 5
 - Avoid "hold forever" unless you know holding_style will be 4-5
2. DO write strategies that work WITH any slider configuration
 - "Buy [tokens] on momentum, take profits at [target]"
 - "Diversify across top performers, scale out on gains"
3. CONSIDER slider settings as the TRUE behavioral driver
 - Strategy text influences token selection and reasoning
 - Sliders determine position sizing and holding duration

BOTTOM LINE:

=====

Strategies that assume specific behaviors (all-in, hold forever, single token) will fail when slider settings enforce different behaviors.

Best strategies are FLEXIBLE and work regardless of slider configuration.
